Task: DNA Synthesizing

You are a bioinformatics researcher working on synthesizing DNA sequences from **multiple columns** of nitrogen-bases. Each **column** represents a set of related samples.

Your task is to implement a function **synthesize_sequence**(given_samples) that takes a 2D array of nitrogen-bases as input and right rotates the given 2D array by 1 unit and returns it**.**

Sample Input 1:

```
given_samples = ( [ ['A', 'C', 'G', 'G'],
                    ['T', 'G', 'A', 'A'],
                    ['G', 'G', 'A', 'C'],
                    ['C', 'T', 'G', 'A'] ] )
```

Output 1:

```
                    [ 'G', 'A', 'C', 'G'],
                    [ 'A', 'T', 'G', 'A'],
                    [ 'C', 'G', 'G', 'A'],
                    [ 'A', 'C', 'T', 'G']
```

Sample Input 2:

```
given_samples = ( [ ['A', 'C', 'G', 'G'],
                    ['T', 'G', 'A', 'A'],
                    ['A', 'G', 'A', 'C'],
                    ['A', 'T', 'G', 'A'] ] )
```

Output 2:

```
                    ['G', 'A', 'C', 'G'],
                    ['A', 'T', 'G', 'A'],
                    ['C', 'A', 'G', 'A'],
                    ['A', 'A', 'T', 'G']
```
